

AI Assignment – Descriptive Questions on Python Variables (Solved)

1. What is a variable?

Answer: A variable is a named storage location that stores data during program execution. It allows values to be reused and modified.

2. How do you declare a variable in Python?

Answer: Python creates variables through assignment. Example: `x = 5`

3. Explain data types.

Answer: Data types define the nature of data stored in a variable. Common types include int, float, string, list, tuple, dictionary, and boolean. Each type determines what operations can be performed.

4. What is variable scope?

Answer: Scope defines where a variable is accessible. Python has local scope (inside functions), global scope (outside functions), and enclosed scope (nested functions).

5. Give an example of reassignment.

Answer: _____
